Irizar Synchronizing Device for WR/SAR Series

The loading and rotation capacity can be double by adding an extra set of rollers. This is valid only if the two sets being used are of the same model and a Irizar Synchronizing Device is used for synchronizing the rotation speed of the two power rollers. The Irizar Synchronizing Device allows the power rollers to rotate at a simultaneous speed by means of an add in control box. Not using the synchronized device may lead to damaging the gearbox, motor burn out and void product warranty.
